

ASX Announcement  
14 March 2017

## High-Grade Goulamina Lithium Deposit Resource Expansion

- ❖ **Updated Goulamina Mineral Resource;**  
**27.8 Mt @ 1.42 % Li<sub>2</sub>O (393,000t contained Li<sub>2</sub>O)**
- ❖ **Interim resource estimate confirms substantial high-grade, near surface expansion to Project resources**
- ❖ **Resource category upgrades and further resource additions expected following inclusion of pending drill results due early May 2017**
- ❖ **Strong potential to add significant tonnages of shallow, high grade lithium mineralisation with further drilling**
- ❖ **Pre-Feasibility Study on track for June 2017 quarter**

Birimian Limited (ASX:BGS; “Birimian” and “Company” - [http://www.commodity-tv.net/c/mid,2697,Company\\_Presentation/?v=297188](http://www.commodity-tv.net/c/mid,2697,Company_Presentation/?v=297188) ) is pleased to report an updated Mineral Resource estimate for the Goulamina deposit, at its Bougouni Lithium Project in Mali.

The Mineral Resource at Goulamina now comprises **27.8 Mt @ 1.42 % Li<sub>2</sub>O, for 393,000 tonnes of contained Li<sub>2</sub>O** (Table 1). This nearly doubles the previous estimate for contained lithia and further confirms Goulamina as among the highest grade, hard rock lithium deposits of significant size globally today.

Commenting on the milestone, Birimian Managing Director Mr Kevin Joyce said, "The latest resource estimate is an outstanding result, which includes extensions to mineralisation at West Zone and the new discovery at Sangar Zone. The combination of these increased resources and expected near-term resource category upgrades will underpin the project Pre-Feasibility Study which is currently in progress.

"Present resources are beyond our early expectations and now exceed the Company's original exploration target for contained lithia. Importantly, there is significant potential to further expand the Goulamina resource.

**"Birimian is in a strong cash position with sufficient capital to fund development activities through to completion of the Project Pre-Feasibility Study, which is expected in the June quarter."**

### **Mineral Resource Estimate**

**Cube Consulting (Cube) was engaged to carry out the updated Mineral Resource estimate for the Goulamina deposit. This estimate now includes extensions at West Zone and the recently discovered Sangar Zone to the south west. Detailed information relating to data, quality control, and estimation methodology are documented in Appendix 1 - JORC Table 1, Sections 1 to 3.**

**Combined resources, estimated to Indicated and Inferred confidence levels, are shown in Table 1. The resource area at the Main Zone pegmatite has not been re-modelled and remains unchanged from the maiden resource estimate (ASX: 27 October 2016).**

Category	Zone	Tonnes	Li <sub>2</sub> O (%)	Li <sub>2</sub> O (tonnes)	Fe <sub>2</sub> O <sub>3</sub>
INDICATED	Main	6,200,000	1.40	87,000	0.86
	West	-	-	-	-
	Sangar	-	-	-	-
<b>INDICATED</b>	<b>TOTAL</b>	<b>6,200,000</b>	<b>1.40</b>	<b>87,000</b>	<b>0.86</b>
INFERRED	Main	3,200,000	1.26	40,000	0.84
	West	13,700,000	1.46	200,000	1.18
	Sangar	4,700,000	1.41	66,000	1.22
<b>INFERRED</b>	<b>TOTAL</b>	<b>21,600,000</b>	<b>1.42</b>	<b>306,000</b>	<b>1.14</b>
	<b>TOTAL</b>	<b>27,800,000</b>	<b>1.42</b>	<b>393,000</b>	<b>1.08</b>

**Table 1. Goulamina Mineral Resource classifications.**

**Birimian provided the principal sources of information used in this Mineral Resource estimate including drilling databases, a topographic surface, mapping information and a geological interpretation of the mineralised pegmatites. An additional 29 holes have been included in the updated estimate, which augment the 51 holes which informed the maiden resource model.**

**Approximately 65 holes were pending assay results at the time of resource estimation and have not been included in the current estimate. These holes include some extensional drilling at Main and West Zone, but largely relate to 25m spaced infill drill sections designed to improve geological and resource confidence. Further resource expansion and resource category upgrades are likely when this drilling is included in a subsequent estimate which is expected in early May.**

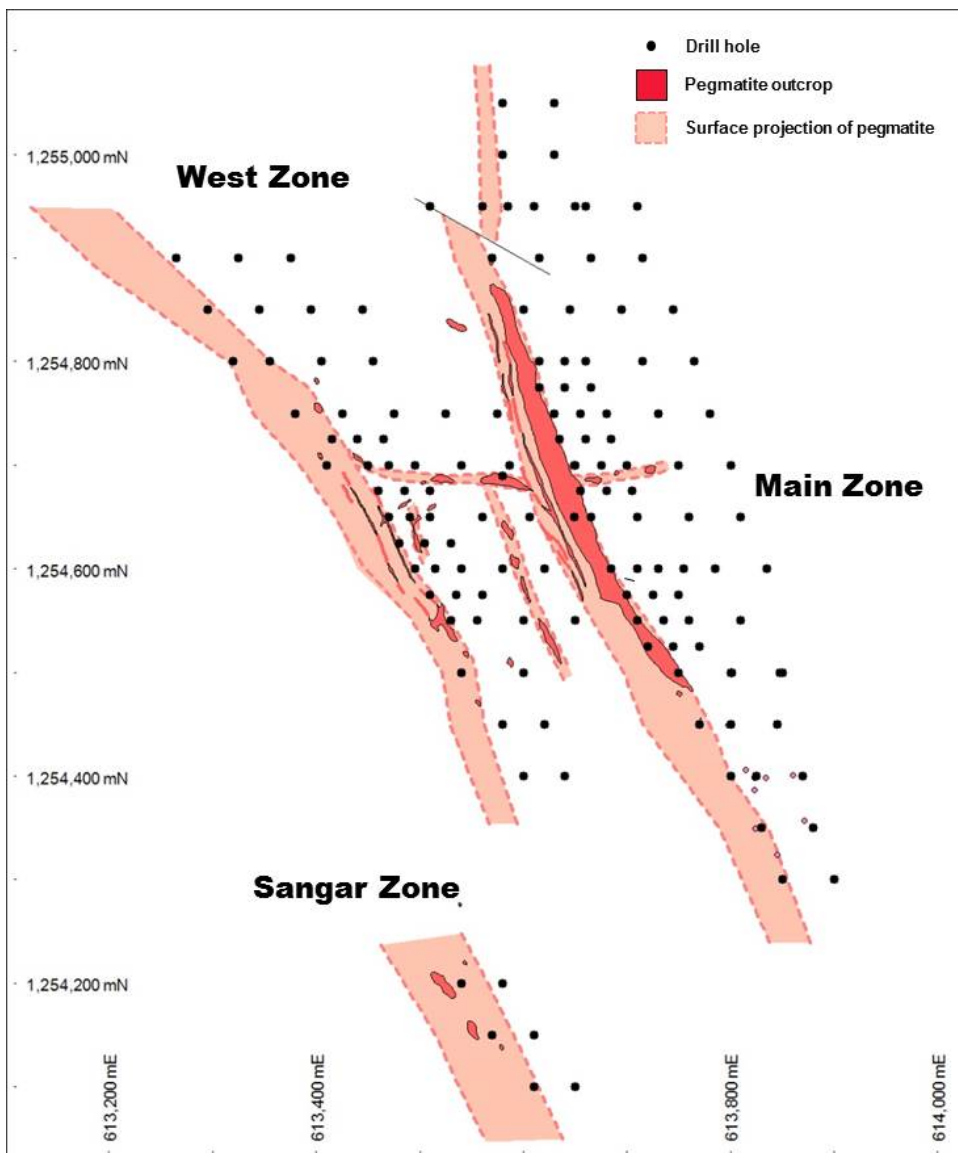

**The mineral resources are defined by reverse circulation (RC) and diamond (DD) drilling. The majority of the new drilling included in the estimate is at 50m x 50m spacing over the West and Sangar pegmatite zones. This spacing is adequate to establish the geological and grade continuity for reporting an Inferred category resource.**

**The spodumene (lithium) pegmatite mineralisation at Goulamina occurs as three well defined, broadly parallel and highly continuous dykes; the Main Zone, West Zone, and**

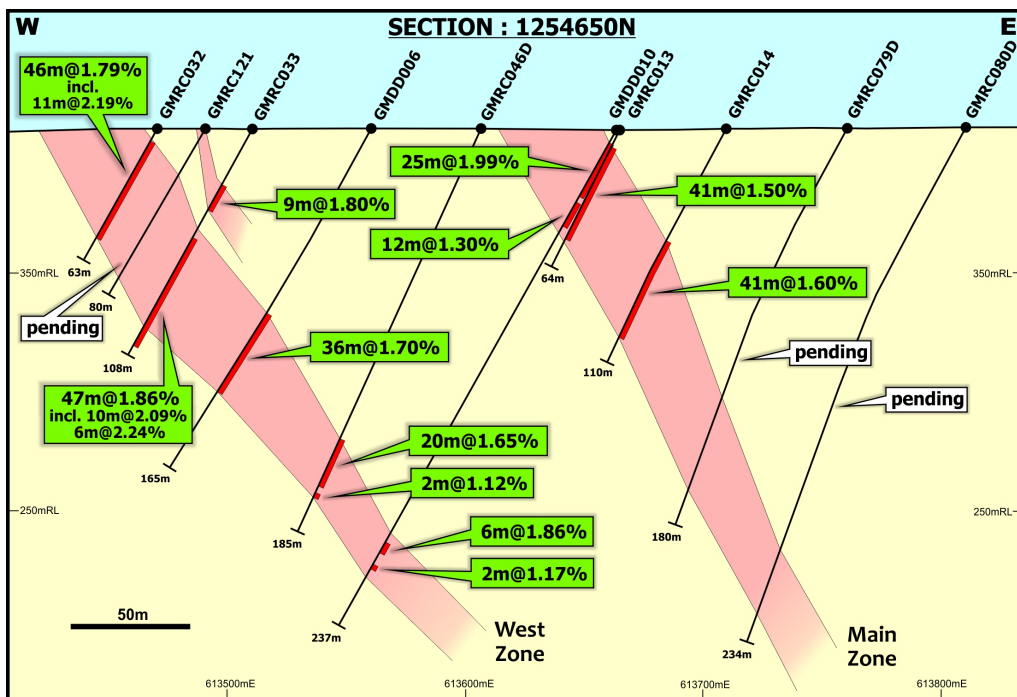

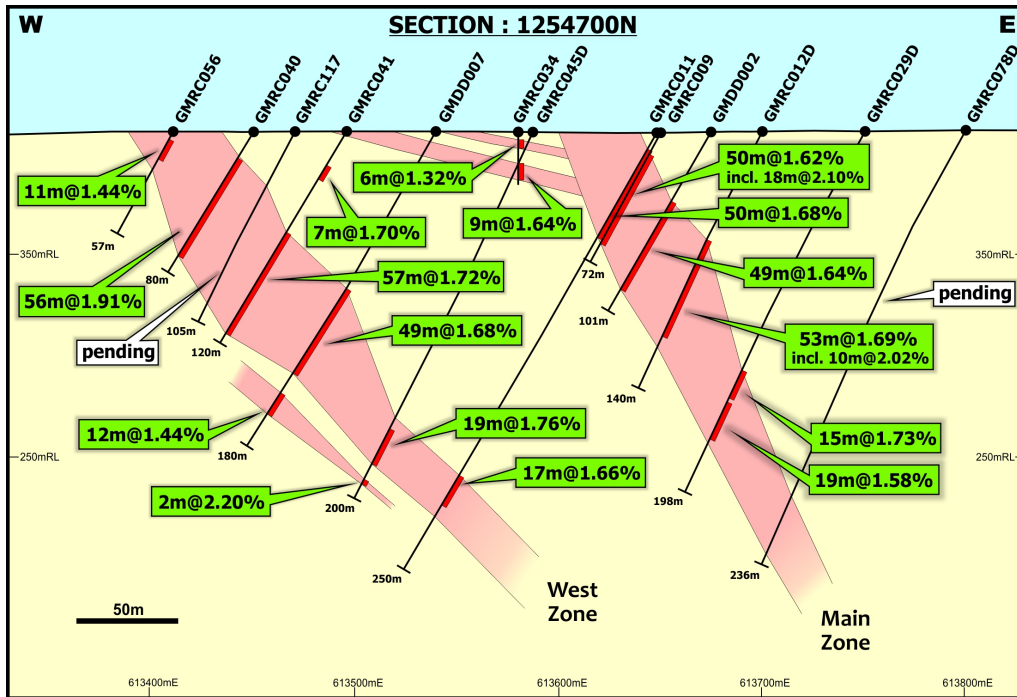

**Sangar Zone (Figure 1, 2 and 3).** Cross cutting mineralised dykes, identified in outcrop and drilling, are less well-defined and have not been included as classified resources at this point in time.

Mineralised domains for separate pegmatite dykes were digitised in cross-section and then wireframed to generate solids. There is a very strong correlation between the mineralised portion of the pegmatite dykes and the total dyke mineralised intercept. Very little pegmatite material is not significantly elevated in lithium content; thus the mineralisation boundaries generally match the lithological boundaries of the dykes. Wireframe solids were used to populate the block model and interpolated  $\text{Li}_2\text{O}$  grade by ordinary kriging methods.

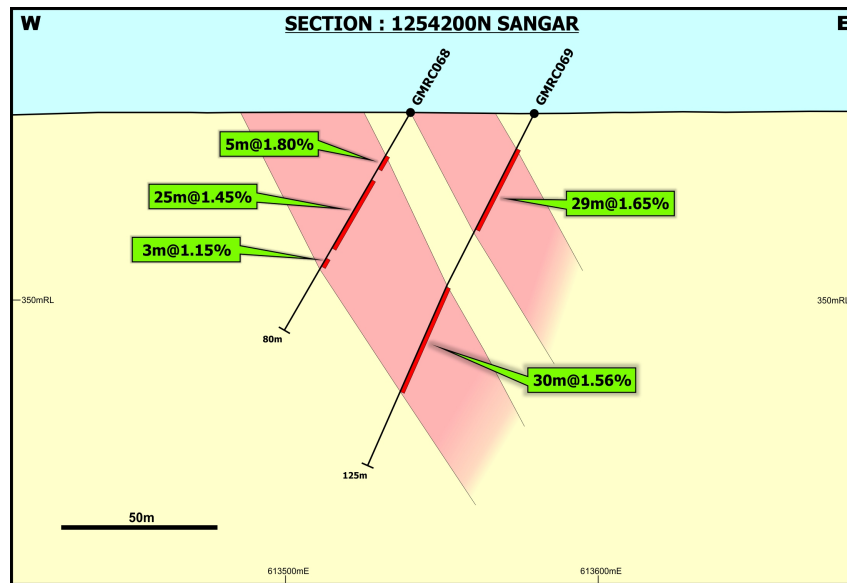

It has been assumed that the resource would be mined using open pit methods, which is supported by conceptual mining studies. The previous metallurgical studies provide a sufficient basis for the assumption regarding metallurgical amenability, and determining reasonable prospects for eventual economic extraction.

**Figure 1. Goulamina Deposit. Plan view of lithium pegmatite with drill hole locations.**

**Figure 2. Goulamina Deposit – Main Zone and West Zone cross sections.**

**Figure 3. Goulamina Deposit – Sangar Zone cross section.**

### **Goulamina – A Large Tonnage High Grade Lithium Deposit**

The updated resource estimate at Goulamina confirms a high-grade and bulk tonnage lithium deposit.

The grade-tonnage curve for updated inferred resources at West Zone is shown in Figure 4. The global resource is reported at 0%  $\text{Li}_2\text{O}$  cut-off. At elevated cut-off grades, the tonnages of mineralisation do not vary substantially. This confirms the robust grade and good continuity of the modelled mineralisation. Increased resource tonnages have resulted in a slight reduction of resource grade, but significantly increased contained lithia. Resource grade remains substantially higher than the estimated mining cut-off grade of 0.82%  $\text{Li}_2\text{O}$ . (ASX: 13 March 2017). The latest resource estimate satisfies Milestone One of the management incentives plan.

Mineralisation is still open at all three mineralised zones and there remains significant untapped exploration potential within the 250km<sup>2</sup> project area. Birimian remains confident that as project development work evolves, it will progressively increase the lithia inventory at Goulamina.

**Figure 4. Goulamina West Zone grade tonnage curve.**

### **Forward Plan**

On 30 January 2017, Birimian announced that the Scoping Study for the Bougouni Lithium Project had confirmed the outstanding potential of the Project, leading to the decision to commence a Pre-Feasibility Study (PFS). Scoping Study results suggest that the Goulamina deposit will be amenable to low cost, open pit mining and staged processing plant development, benefiting from low mining strip ratios, high grade at surface mineralisation, and the low cost operating environment in Mali. The PFS remains on track to be completed during the June 2017 quarter.

Drilling at the Project has paused briefly while the company awaits assay results to undertake further detailed resource estimation work and other resource related technical studies. Given the relatively steady progress with recent drilling and the extended time required for assay to be returned, a further update to the resource model is now anticipated by early May. This estimate is expected to include all results from infill drilling to support significant resource category upgrades and facilitate detailed Pre-Feasibility studies.

In parallel with resource estimation, Birimian continues to advance a number of studies as it works towards completion of the PFS. The Company's strategy is to expedite development of the currently defined resources at the Bougouni Project in lieu of targeting major resource expansions by drilling. The next phase of development drilling is currently being planned. This program will be designed to:

- Further upgrade resource categories
- Confirm geotechnical parameters for open pit mine planning
- Confirm plant, associated infrastructure, waste dump and Tailings Storage Facility locations

Digby Wells Environmental has completed field work relating to the next phase of detailed sustainability studies at the Project and in the broader community. This is important as findings will facilitate ongoing engineering studies and development drilling planning, and

will enable Digby Wells to prepare the Terms of Reference for the Environmental and Social Impact Assessment (ESIA). At this stage it is proposed to present the Project Terms of Reference to government at the end of April, signaling the formal commencement of the project ESIA and leading to mine permitting.

Birimian is seeking to fast-track commercialisation of Bougouni. As such, the other key milestones to look forward to are metallurgical test work results and an upgraded resource estimate, both of which are expected to be completed in the current quarter. Following this, the PFS is expected to also be completed in the June 2017 quarter, enabling the Company to progress project financing and offtake arrangements, in parallel with the mine permitting process.

### **ASX Additional Information - Material Assumptions**

The following is a summary of Material Information used to estimate the Mineral Resource as required by Listing Rule 5.8.1 and JORC 2012 Reporting Guidelines.

#### **Mineral Tenement and Land Tenure Status**

The deposit lies within the Torakoro Research Permit which is owned 100% by Timbuktu Ressources, a wholly owned Malian subsidiary of Birimian Limited. The mineral property is in good standing and there is no known impediment to obtaining a license to operate.

#### **Geology**

The project area is located within the Bougouni region of the southern Mali, where broadly north-south trending belts of Birimian-aged (Paleoproterozoic) metavolcanic and metasedimentary rocks are intruded by syn-and post-orogenic granitoids.

Within the Project area, outcrop is limited and basement geology is therefore poorly understood. Regolith typically comprises a surficial transported gravel horizon (locally termed Cuirasse) overlying a thin lateritic weathering profile. Mapping indicates NE-striking metapelite and metagreywacke rocks in the north and eastern parts of the property. The southern portion of the project area is dominated by granodiorite.

All pegmatite bodies contain anomalous or significant amounts of the mineral spodumene (a lithium-bearing pyroxene), along with the other major minerals of quartz and feldspar (albite and microcline); From the geological logging, there are also accessory amounts of muscovite, tourmaline, apatite, and biotite at the granite contacts.

#### **Drilling Techniques and Hole Spacing**

Holes were drilled in two phases, from May to September 2016, and December 2016 to February 2017. In total 80 holes inform the current resource estimate.

RC drilling was completed by Foraco Drilling and International Drilling Company (IDC), using nominally 5.5" diameter equipment, with a face sampling downhole hammer. The Foraco rig had an outboard compressor, with specifications of 1100CFM@350PSI. The IDC rig had an onboard compressor with specifications of 1150CFM@500PSI

Core drilling was completed using equipment supplied and operated by Foraco Drilling and IDC. All holes are standard HQ sized holes (core diameter 64mm). DD holes are a combination of some drilled from surface and some as diamond tails on RC holes (including extensions to previously drilled Phase 1 holes).

## **Sampling**

All samples collected from the RC rig were collected at 1m downhole intervals. Samples were split into pre-numbered calico bags at the rig using a 3-stage riffle splitter yielding a sample of between 3 to 5 kilograms. In addition to the 1m sample, duplicate samples were taken every 20m downhole. Blanks and standards were inserted into the sample stream at a rate of 1:40 for Blanks, and 1:40 for Standards.

All data is documented in a sampling ledger, including hole number, date drilled, sample id, depths from and to, sample condition, sample type, percentage sample return and all certified standards blanks and duplicates.

Drill core was sawn in half along its long axis. One half of the drill core was taken for geochemical analysis. All samples were collected at 1m intervals down the hole. 100% core recoveries were typically achieved.

## **Sample Analysis**

Sample preparation work was conducted in the ALS Laboratory in Ouagadougou, Burkina Faso. At the laboratory, samples were weighed, dried and crushed to -2mm in a jaw crusher. A 1.0kg split of the crushed sample was subsequently pulverised in a ring mill to achieve a nominal pulp particle size of 85% passing 75µm. Sample sizes and laboratory preparation techniques are considered to be appropriate.

After pulverisation, sub-samples were sent to ALS Laboratory in Perth for assay. Analysis for lithium and a suite of other elements was undertaken by ICP-AES, after a sodium peroxide ( $\text{Na}_2\text{O}_2$ ) fusion – ALS Method ME-ICP89. Some of the multi-element analysis uses a MS finish – ALS Method ME-MS91. This fusion technique is considered to be a “total” dissolution technique for lithium-bearing silicate minerals. Detection limits for lithium are 0.01-10%.

## **Estimation Methodology**

Interpreted sections were wireframed using Surpac software to create 3D solids for each pegmatite domain within the resource area. The drillhole data was sliced on 50m spaced sections for modelling of the geology and the mineralised envelopes. Solids were constructed for 4 discreet pegmatite dykes, as well as for the near surface colluvium and lateritic material.

Mineralisation in the Main Zone and West Zone pegmatites was composited to 3m downhole intervals to reduce the variability inherent in raw samples or a smaller composite length relative to estimation resource model block dimensions.

Surpac software was used for the modelling and estimation, with SuperVisor software used to conduct geostatistical analysis. The main pegmatite domains in the block model were estimated using interpolation of grade via Ordinary Kriging (OK), which was considered to be an acceptable method given the strong geological control, the drilling density and the data distribution downhole.

A single block model was created by Cube with dimensions extended out to fully cover all of the mineralisation, plus surrounds that may be contained within pit optimisation shells. The parent block size used is 20mN x 20mE x 5mRL and sub-blocked to 1.25mN x 2.5mE x 2.5mRL.

## **Resource Classification**

A range of criteria were considered by Cube when addressing the suitability of the classification boundaries. These criteria include:

- Geological continuity and volume;
- Drill spacing and drill data quality;
- Modelling technique; and
- Estimation properties including search strategy, number of informing composites, average distance of composites from blocks and kriging quality parameters.

Blocks have been classified as Indicated or Inferred, mostly based on drill data spacing in combination with kriging parameters.

## **Cut-off Grade**

For the global resource estimation, no lower cutoff grade for reporting is used, as the model is essentially developed within a geological boundary, and the resource incorporates everything within the modelled pegmatite dykes.

## **Mining and Metallurgy**

Conceptual mining studies are based on open cut mining methods using a contract mining fleet and conventional drill and blast mining methods. Limited inspection of core photography indicates that ground conditions are suitable for this mining method.

The resource has been trimmed by intersecting with a pit shell based on a Whittle optimisation at a revenue factor (USD\$650/t for a nominal 6% Li<sub>2</sub>O concentrate). Material falling outside of this shell is considered to not meet reasonable prospects for eventual economic extraction. Reasonable prospects for eventual economic extraction have been determined with reference to the results of previous Whittle optimization studies, and the depth of the selected open pit shell (at a revenue factor of USD\$650/t for a nominal 6% Li<sub>2</sub>O concentrate) was used as an analogy to help limit the depth for reporting the Sangar Zone.

The criteria for assumptions and predictions regarding metallurgical amenability – required to determine reasonable prospects for eventual economic extraction – are based on the bulk sampling and test program undertaken in 2008 by CSA Global (UK), work that was commissioned and funded by the World Bank as part of the SYSMIN economic development program. CSA Global undertook systematic sampling of outcropping material at Goulamina to collect a representative bulk sample comprising 3,150kg of material, which was subsequently crushed and split to 750kg for detailed processing test work. This work included evaluations of screen sizing to optimize spodumene (lithium) recoveries and preliminary dense media separation tests. The results of this study indicated good spodumene recoveries and a high mass yield, to produce a high quality chemical grade spodumene concentrate.

### **Competent Persons Declaration**

*The information in this announcement that relates to exploration results and the Exploration Target is based on information compiled by or under the supervision of Kevin Anthony Joyce. Mr Joyce is Managing Director of Birimian Limited and a Member of the Australian Institute of Geoscientists. Mr Joyce has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and the activity he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the “Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (‘the JORC Code’)”. Mr Joyce consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.*

*The information in this announcement that relates to Mineral Resources is based on information compiled by or under the supervision of Mr. Matt Bampton, who is a Member of The Australasian Institute of Mining and Metallurgy and a Member of the Australian Institute of Geoscientists. Mr Bampton is a full-time employee of Cube Consulting Pty Ltd and has sufficient experience which is relevant to the styles of mineralisation and types of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the “Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (‘the JORC Code’)”. Mr Bampton consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.*

**Previous Reported Results**

*There is information in this announcement relating to previous Exploration Results at the Bougouni Project. The Company confirms that it is not aware of any other new information or data that materially affects the information included in the original market announcement, and that all material assumptions and technical parameters have not materially changed. The Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcement.*

**Forward Looking Statements**

*Statements regarding plans with respect to the Company's mineral properties are forward looking statements. There can be no assurance that the Company's plans for development of its mineral properties will proceed as expected. There can be no assurance that the Company will be able to confirm the presence of mineral deposits, that any mineralisation will prove to be economic or that a mine will successfully be developed on any of the Company's mineral properties.*

**JORC Code, 2012 Edition – Table 1**

<p><b>Location of data points</b></p>	<ul style="list-style-type: none"> <li>• <i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i></li> <li>• <i>Specification of the grid system used.</i></li> <li>• <i>Quality and adequacy of topographic control.</i></li> </ul>	<ul style="list-style-type: none"> <li>• Drill hole collars were set out in UTM grid WGS84_Zone29N</li> <li>• Drill hole collars were positioned using hand held GPS.</li> <li>• RC and DD holes are routinely surveyed for orientation at approximately 50m-spaced intervals down the hole, using the Reflex EZ-TRAC electronic multi-shot system</li> <li>• SRTM elevation data was used to</li> </ul>

Criteria	JORC Code explanation	Commentary
		<p>establish topographic control where appropriate.</p> <ul style="list-style-type: none"> <li>• Locational accuracy at collar and down the drill hole is considered appropriate for this stage of resource estimation.</li> </ul>
<b>Data spacing and distribution</b>	<ul style="list-style-type: none"> <li>• <i>Data spacing for reporting of Exploration Results.</i></li> <li>• <i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i></li> <li>• <i>Whether sample compositing has been applied.</i></li> </ul>	<ul style="list-style-type: none"> <li>• The majority of drilling is at 50m x 50m centres, with deeper holes at 100m x 50m spacing, and some minor infill to approximately 50m x 25m on selected sections.</li> <li>• This spacing is adequate to determine the geological and grade continuity for reporting of Mineral Resources.</li> <li>• Compositing to 3m lengths has been applied for the estimation of Mineral Resources</li> </ul>
<b>Orientation of data in relation to geological structure</b>	<ul style="list-style-type: none"> <li>• <i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i></li> <li>• <i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i></li> </ul>	<ul style="list-style-type: none"> <li>• Mineralisation at Goulamina outcrops at surface and the steeply dipping geometry of mineralisation is therefore well-defined.</li> <li>• Drilling orientation has not biased the sampling.</li> </ul>
<b>Sample security</b>	<ul style="list-style-type: none"> <li>• <i>The measures taken to ensure sample security.</i></li> </ul>	<ul style="list-style-type: none"> <li>• Samples are stored on site prior to road transport by Company personnel to the ALS Laboratory in Bamako, Mali.</li> <li>• Chain of custody procedures exist for the transport of material between ALS Laboratories (Mali to Burkina Faso to Perth).</li> </ul>
<b>Audits or reviews</b>	<ul style="list-style-type: none"> <li>• <i>The results of any audits or reviews of sampling techniques and data.</i></li> </ul>	<ul style="list-style-type: none"> <li>• Cube Consulting undertook a site visit during RC drilling operations to review the sampling techniques.</li> <li>• There has been no external audit or review of the Company's sampling techniques for diamond drilling.</li> </ul>

## Section 2 - Reporting of Exploration Results

Criteria	JORC Code explanation	Commentary
<b>Mineral tenement and land tenure status</b>	<ul style="list-style-type: none"> <li>• <i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i></li> <li>• <i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i></li> </ul>	<ul style="list-style-type: none"> <li>• The reported results are from an area within the Torakoro Permit, which is held 100% by Timbuktu Resources SARM, a Malian subsidiary of Birimian Limited</li> <li>• Tenure is in good standing.</li> </ul>
<b>Exploration done by other</b>	<ul style="list-style-type: none"> <li>• <i>Acknowledgment and appraisal of exploration by other parties.</i></li> </ul>	<ul style="list-style-type: none"> <li>• The area which is presently covered by the Torakoro Permit was explored intermittently by government</li> </ul>

<b>Criteria</b>	<b>JORC Code explanation</b>	<b>Commentary</b>
<i>parties</i>		<p>agencies in the period 1990 to 2008. Exploration consisted of soil sampling and mapping for gold.</p> <ul style="list-style-type: none"> <li>• In 2007-2008 an evaluation of the commercial potential for lithium at Goulamina was undertaken by CSA Global as part of the SYSMIN 7 economic development program.</li> <li>• CSA undertook mapping and bulk sampling of the Goulamina outcrop but did not undertake drilling. Bulk sampling and preliminary processing testwork confirmed the viability of the pegmatite at Goulamina to produce a high quality chemical grade lithium concentrate</li> </ul>
<b>Geology</b>	<ul style="list-style-type: none"> <li>• <b>Deposit type, geological setting and style of mineralisation.</b></li> </ul>	<ul style="list-style-type: none"> <li>• <b>Pegmatite Hosted Lithium Deposits are the target for exploration. This style of mineralisation typically forms as dykes and sills intruding or in proximity to granite host rocks.</b></li> <li>• <b>Surficial geology within the project area typically consists of indurated gravels forming plateaux, and broad depositional plains consisting of colluvium and alluvial to approximately 5m vertical depth.</b></li> <li>• <b>Lateritic weathering is common away from the Goulamina deposit and in the broader project area.</b></li> </ul>
<b>Drill hole Information</b>	<ul style="list-style-type: none"> <li>• <b>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</b> <ul style="list-style-type: none"> <li>○ <b>easting and northing of the drill hole collar</b></li> <li>○ <b>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</b></li> <li>○ <b>dip and azimuth of the hole</b></li> <li>○ <b>down hole length and interception depth</b></li> <li>○ <b>hole length.</b></li> </ul> </li> <li>• <b>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</b></li> </ul>	<ul style="list-style-type: none"> <li>• <b>All relevant data from 2016 and 2017 drilling programs has been previously released to the market.</b></li> </ul>
<b>Data aggregation methods</b>	<ul style="list-style-type: none"> <li>• <b>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</b></li> <li>• <b>Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should</b></li> </ul>	<ul style="list-style-type: none"> <li>• <b>All relevant data from 2016 and 2017 drilling programs has been previously released to the market.</b></li> </ul>

<b>Criteria</b>	<b>JORC Code explanation</b>	<b>Commentary</b>
	<p><i>be shown in detail.</i></p> <ul style="list-style-type: none"> <li><i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i></li> </ul>	
<b>Relationship between mineralisation widths and intercept lengths</b>	<ul style="list-style-type: none"> <li><i>These relationships are particularly important in the reporting of Exploration Results.</i></li> <li><i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i></li> <li><i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</i></li> </ul>	<ul style="list-style-type: none"> <li><b>All relevant data from 2016 and 2017 drilling programs has been previously released to the market</b></li> </ul>
<b>Diagrams</b>	<ul style="list-style-type: none"> <li><i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i></li> </ul>	<ul style="list-style-type: none"> <li><b>All relevant data from 2016 and 2017 drilling programs has been previously released to the market</b></li> </ul>
<b>Balanced reporting</b>	<ul style="list-style-type: none"> <li><i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i></li> </ul>	<ul style="list-style-type: none"> <li><b>All relevant data from 2016 and 2017 drilling programs has been previously released to the market</b></li> </ul>
<b>Other substantive exploration data</b>	<ul style="list-style-type: none"> <li><i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i></li> </ul>	<ul style="list-style-type: none"> <li><b>Density measurements taken by Archimedes Method (water displacement) of core samples from 14 holes, all in unweathered material.</b></li> <li><b>Whole core and some half core samples were used for density measurements, but neither coated nor waxed.</b></li> <li><b>These measurements were used to determine the bulk density for the Mineral Resource.</b></li> <li><b>In addition to lithium (as Li<sub>2</sub>O), all holes were assayed for a multi-element suite to evaluate the presence of any potential co-product or contaminating material.</b></li> </ul>
<b>Further work</b>	<ul style="list-style-type: none"> <li><i>The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).</i></li> <li><i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i></li> </ul>	<ul style="list-style-type: none"> <li><b>The Mineral Resource estimate will be used to support ongoing economic assessments of the key processing parameters and estimate capital costs, which will be used to define subsequent phases of detailed work at the Bougouni Li Project.</b></li> <li><b>An environmental consultancy has completed a preliminary social and environmental assessment, and is currently undertaking the next phase of detailed site based surveys to facilitate a mine permitting process.</b></li> </ul>

### **Section 3 - Estimation and Reporting of Mineral Resources**

<b>Criteria</b>	<b>JORC Code explanation</b>	<b>Commentary</b>
<b>Database integrity</b>	<ul style="list-style-type: none"> <li>• <i>Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.</i></li> <li>• <i>Data validation procedures used.</i></li> </ul>	<ul style="list-style-type: none"> <li>• <b>Drilling database is maintained by Birimian’s database consultant (Rock Solid Data Consultancy) in Datashed software, look-up tables and fixed formatting are used for entering logging, spatial and sampling data for the deposit databases. Sample numbers are uniquely coded and pre-numbered bags used. Data transfer for downhole survey and assaying information is electronic via email. These and other workflow methods minimise the potential of errors.</b></li> <li>• <b>Cube received data directly exported from Datashed in MS Access format, then completed validation checks on the database comparing maximum hole depths checks on all data, duplicate numbering, missing data, and interval error checks using validation rules in MS Excel before importing records into MS Access. Cube then verified the data using visual inspection of the drillholes in Surpac v6.7, in 3D to identify inconsistencies of drill hole traces.</b></li> </ul>
<b>Site visits</b>	<ul style="list-style-type: none"> <li>• <i>Comment on any site visits undertaken by the Competent Person and the outcome of those visits.</i></li> <li>• <i>If no site visits have been undertaken indicate why this is the case.</i></li> </ul>	<ul style="list-style-type: none"> <li>• <b>Matt Bampton (Senior Consultant – Cube Consulting) who is the Competent Person, conducted a site visit in May 2016, during which time he inspected the Project area including RC drilling, sampling and sample despatch for the receiving laboratory. Notes and photographs were taken along with discussions with site personnel regarding geology and mineralisation of the deposits, procedures, sampling and database procedures, and Quality Control procedures. No major issues were encountered.</b></li> </ul>
<b>Geological interpretation</b>	<ul style="list-style-type: none"> <li>• <i>Confidence in (or conversely, the uncertainty of ) the geological interpretation of the mineral deposit.</i></li> <li>• <i>Nature of the data used and of any assumptions made.</i></li> <li>• <i>The effect, if any, of alternative interpretations on Mineral Resource estimation.</i></li> <li>• <i>The use of geology in guiding and controlling Mineral Resource estimation.</i></li> <li>• <i>The factors affecting continuity both of grade and geology.</i></li> </ul>	<ul style="list-style-type: none"> <li>• <b>The confidence in the geological interpretation of Main Zone and West Zone of the Goulamina Pegmatites is good as a result of the consistency of intercepts in RC and diamond core drilling programs, and their correlation to the surface outcrops and sub-crops of spodumene-rich pegmatites.</b></li> <li>• <b>There is a very strong correlation between the mineralised portion of the pegmatite dykes and the total dyke intercept. Very little pegmatite material is not significantly elevated in lithium content; thus the mineralisation boundaries generally match the lithological boundaries of the dykes.</b></li> <li>• <b>The confidence in the geological interpretation of the Sangar Zone of the Goulamina Pegmatites is lower, as the minor surface outcrop and sub-crop is supported by only 6 drill-hole</b></li> </ul>

Criteria	JORC Code explanation	Commentary
<b>Dimensions</b>	<ul style="list-style-type: none"> <li><i>The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.</i></li> </ul>	<p>intercepts. This confidence is reflected in the resource classification.</p> <ul style="list-style-type: none"> <li>The Goulamina Mineral Resource area has dimensions of 900m (strike length) in three main dykes up to 70m (true width) and 225m (below surface). The maximum depth known to date for the deepest mineralisation is 195m below the surface.</li> </ul>
<b>Estimation and modelling techniques</b>	<ul style="list-style-type: none"> <li><i>The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.</i></li> <li><i>The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.</i></li> <li><i>The assumptions made regarding recovery of by-products.</i></li> <li><i>Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).</i></li> <li><i>In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.</i></li> <li><i>Any assumptions behind modelling of selective mining units.</i></li> <li><i>Any assumptions about correlation between variables.</i></li> <li><i>Description of how the geological interpretation was used to control the resource estimates.</i></li> <li><i>Discussion of basis for using or not using grade cutting or capping.</i></li> <li><i>The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.</i></li> </ul>	<ul style="list-style-type: none"> <li>The block model was constructed using interpolation of grade via Ordinary Kriging (OK), with an Inverse Distance method used as an internal check; a global model was considered to be appropriate for the purpose of the model.</li> <li>High grade values were reviewed, but it was considered that application of top-cuts was not required.</li> <li>Mineralised domains for 6 separate pegmatite dykes were digitised in cross-section using 3D strings and then wireframed to generate solids. These were a subset of lithological wireframes of these pegmatite dykes.</li> <li>Drillhole sample data was flagged using domain codes generated from three dimensional mineralisation domains and oxidation surfaces. Sample data was composited to three metre downhole lengths using a best fit-method.</li> <li>Interpolation parameters were set to a minimum number of 12 composites and a maximum number of 24 composites for the estimate. A maximum search ellipse of 150m was used for estimation runs in the reportable resource, with the orientation altered dynamically to reflect the change in orientation of the West Zone pegmatite domain.</li> <li>Computer software used for the modelling and estimation was Surpac v6.7, with SuperVisor software used to conduct geostatistical and variographic analysis.</li> <li>No by-product recoveries were considered; Fe<sub>2</sub>O<sub>3</sub> was estimated, as an element of potential interest in terms of a future spodumene concentrate.</li> <li>The parent block size used is 20mN x 20m E x 5m RL and sub-blocked to 1.25mN x 2.5mE x 2.5mRL. The bulk of the drilling data was on 50m x 50m spaced sections, with limited infill to 25m x 25m spaced sections.</li> <li>No assumptions of selective mining units were made.</li> <li>The mineralised domains acted as a hard boundary to control the Mineral Resource estimate.</li> </ul>

Criteria	JORC Code explanation	Commentary
		<ul style="list-style-type: none"> <li>Block model validation was conducted by the following means:</li> <li>Visual inspection of block model estimation in relation to raw drill data on a section by section basis.</li> <li>Volumetric comparison of the wireframe/solid volume to that of the block model volume for each domain.</li> <li>A global statistical comparisons of input and block grades, and local composite grade (by northing and RL) relationship plots (swath plots), to the block model estimated grade for each domain.</li> <li>Comparison of the (de-clustered) cut grade drill hole composites with the block model grades for each lode domain in 3D.</li> <li>No mining has taken place and therefore no reconciliation data is available.</li> </ul>
<b>Moisture</b>	<ul style="list-style-type: none"> <li>Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.</li> </ul>	<ul style="list-style-type: none"> <li>The tonnages are estimated on a dry basis.</li> </ul>
<b>Cut-off parameters</b>	<ul style="list-style-type: none"> <li>The basis of the adopted cut-off grade(s) or quality parameters applied.</li> </ul>	<ul style="list-style-type: none"> <li>Cut-off grade for reporting is 0.0% Li<sub>2</sub>O, reflecting the global nature of the resource, the grade-tonnage relationships, and a potential bulk mining scenario based on the lithological contacts.</li> </ul>
<b>Mining factors or assumptions</b>	<ul style="list-style-type: none"> <li>Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.</li> </ul>	<ul style="list-style-type: none"> <li>The previous preliminary mining studies are based on open cut mining methods using a contract mining fleet and conventional drill and blast mining methods.</li> <li>These studies have been used to generate an open pit shell to limit the material in the block model to that component which is considered to have reasonable prospects for eventual economic extraction.</li> <li>The depth of this open pit shell was used as an analogy to help limit the depth for reporting the Sangar Zone.</li> </ul>
<b>Metallurgical factors or assumptions</b>	<ul style="list-style-type: none"> <li>The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this</li> </ul>	<ul style="list-style-type: none"> <li>In 2007-2008 CSA undertook mapping and bulk sampling of the Goulamina outcrop but did not undertake drilling.</li> <li>They collected a representative bulk sample comprising 3,150kg of material, which was subsequently crushed and split to 750kg for detailed processing test work.</li> <li>This work included evaluations of screen sizing to optimize spodumene (lithium) recoveries and preliminary dense media separation tests.</li> </ul>

<b>Criteria</b>	<b>JORC Code explanation</b>	<b>Commentary</b>
	<i>should be reported with an explanation of the basis of the metallurgical assumptions made.</i>	<ul style="list-style-type: none"> <li>The results of this study indicated good spodumene recoveries and a high mass yield, to produce a high quality 'chemical grade' spodumene concentrate.</li> </ul>
<b>Environmental factors or assumptions</b>	<ul style="list-style-type: none"> <li><i>Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.</i></li> </ul>	<ul style="list-style-type: none"> <li>A social and environmental screening assessment for areas around the potential mine and processing site at Goulamina has been undertaken by an established environmental consultancy.</li> <li>No major social or environmental impediments were foreseen.</li> <li>An environmental consultancy has been engaged to plan and undertake more detailed baseline monitoring studies, and to commence a formal Environmental and social Assessment to support the Project.</li> <li>No specific assumptions have been made regarding possible waste and process residue disposal options.</li> </ul>
<b>Bulk density</b>	<ul style="list-style-type: none"> <li><i>Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.</i></li> <li><i>The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.</i></li> <li><i>Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.</i></li> </ul>	<ul style="list-style-type: none"> <li>Bulk density determination for unweathered material is derived from an analysis of dry density measurements of drill core from 14 diamond holes.</li> <li>Whole core was used, but neither coated nor waxed. The risk of not using a method which adequately accounts for potential void spaces is considered to be low in both the pegmatites and granitic rocks.</li> <li>In weathered material (including minor transported colluvium and <i>in-situ</i> laterite), bulk density was assumed, based on data from other equivalent granite-hosted deposits.</li> <li>Bulk density was assigned within the block model attribute 'density' according to the weathering profiles and rock types.</li> </ul>
<b>Classification</b>	<ul style="list-style-type: none"> <li><i>The basis for the classification of the Mineral Resources into varying confidence categories.</i></li> <li><i>Whether appropriate account has been taken of all relevant factors (i.e. relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).</i></li> <li><i>Whether the result appropriately reflects the Competent Person's view of the deposit.</i></li> </ul>	<ul style="list-style-type: none"> <li>Blocks have been classified as Indicated or Inferred, based on a combination of data spacing, interpolation metadata (number of composites used, conditional bias slope, kriging variance) and geological understanding. Indicated Mineral Resources are defined nominally on 50m x 50m to 50m x 25m spaced drilling within the Main Zone pegmatite. Inferred Mineral Resources are in part defined by data density greater than 50m x 50m spaced drilling within the Main Zone pegmatite, and for the bulk of the West Zone and Sangar pegmatites.</li> <li>The Mineral Resource estimate appropriately reflects the Competent Person's view of the deposit.</li> </ul>

<b>Criteria</b>	<b>JORC Code explanation</b>	<b>Commentary</b>
<b>Audits or reviews</b>	<ul style="list-style-type: none"> <li><i>The results of any audits or reviews of Mineral Resource estimates.</i></li> </ul>	<ul style="list-style-type: none"> <li>Whilst Mr. Bampton (Competent Person) is considered to be independent of Birimian, no third party reviews have as yet been completed on this Mineral Resource</li> </ul>
<b>Discussion of relative accuracy/confidence</b>	<ul style="list-style-type: none"> <li><i>Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.</i></li> <li><i>The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.</i></li> <li><i>These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.</i></li> </ul>	<ul style="list-style-type: none"> <li>The relative accuracy of the Mineral Resource estimate is reflected in the reporting of the Mineral Resource in accordance with the guidelines of the 2012 JORC Code.</li> <li>The statement relates to global estimates of tonnes and grade.</li> </ul>
